

Kaleido

EXECUTIVE OVERVIEW

Typed. Discoverable. Stateful.

A .NET framework for exposing typed queries and stateful business processes as machine-discoverable HTTP capabilities.

Workflows • channels • interoperability • governed AI
OPEN-SOURCE PROJECT OVERVIEW

PRE-1.0 PROJECT PREVIEW

The integration tax grows with every new consumer

Without a shared capability contract, each workflow, channel, standard, and agent rebuilds the same business integration.

BEFORE KALEIDO

Each consumer builds its own path

-  **Workflow / Pega** own adapter • mapping • rules
-  **IVR / contact center** own adapter • mapping • rules
-  **Web and mobile** own adapter • mapping • rules
-  **Da Vinci / partners** own adapter • mapping • rules
-  **AI agents** own adapter • mapping • rules

Repeated validation, state handling, errors, testing, and maintenance.

COST AND INCONSISTENCY COMPOUND

Kaleido
Typed. Discoverable. Stateful.
A .NET framework for building discoverable business queries and stateful processes over HTTP.

[.NET](#) [Open Source](#) [MIT License](#) [AI Friendly](#)

-  **Discoverable**
Self-describing APIs with rich metadata.
-  **Stateful Processes**
Long-running, multi-step workflows with a clear process model.
-  **Typed Queries**
Expose data through strongly typed, queryable endpoints.
-  **Extensible**
Clean extension points where they add real value (and no more).
-  **Built for AI**
Machine-readable capabilities designed for modern AI agents and tools.

Kaleido helps you expose your business capabilities as machine-discoverable, typed, and stateful APIs. It's designed for developers building modern applications, integrations, and AI agents.

[Get Started →](#) [Documentation](#)

```
C# HTTP JSON
// Execute a discovered process step
var client = new KaleidoClient(new Uri("https://api.example.com"));
var response = await client.Processes
    .For("orders")
    .PostAsync(new { "id": 12345 });
```

AFTER: ONE SHARED CAPABILITY CONTRACT

Three business building blocks make the model memorable

The executive language describes the outcome; the Kaleido term identifies the framework primitive.

BUSINESS INFORMATION + BUSINESS ACTIONS + CAPABILITY CATALOG = A SHARED OPERATING MODEL

Build once. Reuse everywhere.

One capability model across every channel—without replacing workflow, channel, or interoperability platforms.

Kaleido is the contract layer—not the workflow engine, channel runtime, or interoperability standard.

The platforms keep doing what they do best.

Where Kaleido fits first

The immediate value is reuse across orchestration, voice channels, and standards-based integrations. AI follows from the same foundation.

WORKFLOW & CASE MANAGEMENT

Pega and similar platforms

Keep orchestration, SLAs, assignments, decisions, and human work in the workflow platform. Call Kaleido for reusable business information and actions.

SHARED CONTRACTS

LESS CUSTOM INTEGRATION

Workflow platforms coordinate the work; Kaleido standardizes the business capabilities they call.

IVR / CONTACT CENTER

Voice and assisted channels

Use capability metadata to drive prompts and validation, preserve a process ID, and resume the same journey across transfers, agents, web, or mobile.

CONSISTENT PROMPTS

CHANNEL CONTINUITY

One business action can support voice, agent desktop, and digital self-service.

STANDARDS & EXTERNAL PARTNERS

Da Vinci CRD · DTR · PAS

Handle FHIR- and X12-oriented exchange at the boundary, then map it into stable internal information and action contracts that other consumers can reuse.

STANDARDS AT EDGE

STABLE INTERNAL MODEL

CRD surfaces requirements, DTR supports documentation capture, and PAS supports prior-authorization exchange.

CROSS-CUTTING RESULT: digital experiences and AI agents consume the same catalog rather than introducing another bespoke integration path.

AI becomes another governed consumer

Typed, discoverable capabilities let an agent use the same business contracts as workflow tools and channels—not unrestricted authority.

Discover

Read the catalog

Understand

Schemas and constraints

Choose

Select an allowed capability

Execute

Call the advertised route

Continue

Use processId and next steps

THE SHARED CATALOG ENABLES

Machine-readable operating context

- Capability names, descriptions, schemas, and constraints
- Advertised query and execution routes
- Explicit process identity and next-step guidance
- Structured results, errors, and correlation context

ENTERPRISE GOVERNANCE ADDS

A controlled decision boundary

- Authorization-aware discovery and allowlists
- Confirmation and side-effect classifications
- Durable idempotency and concurrency guarantees
- Registry freshness, redaction, and resource limits

One process. Multiple channels. Same business rules.

The PriorAuth sample makes the operating model tangible: consumers change, while the capability contracts and process state remain consistent.

Standardize once. Reuse everywhere.

Kaleido is not another workflow engine, channel platform, or interoperability layer.
It is the shared capability contract that allows all of them to work together.

One capability model

Business information, actions, metadata, validation, and state are defined consistently.

Many consumers

Pega, IVR, digital channels, Da Vinci integrations, partners, and agents reuse the same contract.

Consistent behavior

Channels can change without duplicating the business rules or redefining the journey.

DEFINE BUSINESS CAPABILITIES ONCE

Then allow every authorized consumer to discover and use them consistently.
