Kaleido

.NET QUERY + PROCESS FRAMEWORK

Business services. Ready for AI.

Build reusable business queries and executable process steps.

Run the business code. Record progress. Return what can happen next.

HTTP for applications. MCP for AI agents. One service-owned business model.

Make the process visible. Stop rebuilding it.

WHY I STARTED

The idea needed a working example.

Years of explaining steps were not making real scenarios click.

Show inputs. Behavior. Reuse.

THE DELIVERY PROBLEM

One change should not become two implementations.

Service team
changes the process

→

Agent team
updates its copy

Duplicated workflow ownership creates another release dependency.

Make business behavior explicit once - not a separate journey in every consumer.

Information. Actions. Discovery.

A step is a business action - not a screen or a chat turn.

QUERYABLE

Read business information.

Find a member.

Searchable sources and views.

PROCESS

Execute business actions.

Capture the member.

Inputs, rules, handler, state.

REGISTRY

Describe how to find and call them.

Publish the capability.

Names, schemas and routes.

INPUT + CURRENT PROGRESS

Member + enrollment + date

→ **Capture Member** →

RESULT + NEXT

Required, available, or waiting

This is service code - not agent code.

Product-owned metadata becomes the interface consumers receive.

CAPTUREMEMBERSTEP / SELECTED FRAGMENTS; ... MARKS OMITTED CODE

```
[ProcessStep(DisplayName =
    "Intake - Capture Member", ...)]
```

```
[AvailableAfter<ValidateMemberStep>]
```

```
[Display(Name = "Date of service",
    Prompt = "What is the date of service?")]
```

```
[Lookup(Service = "member",
    View = nameof(MemberSearchViewSource),
    Field = "MemberId", ...)]
```

NAME THE ACTION

What the business action is.

Its name and purpose come from the service.

DECLARE AVAILABILITY

Validation must have completed.

DESCRIBE THE INPUT

Supply its label and prompt.

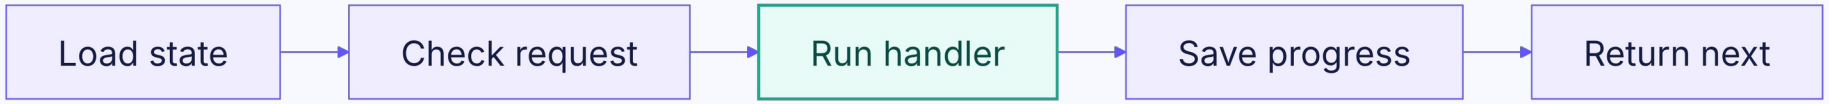

The interaction wording is service-owned.

IDENTIFY THE LOOKUP

Say where the value comes from.

Member Search and its MemberId field.

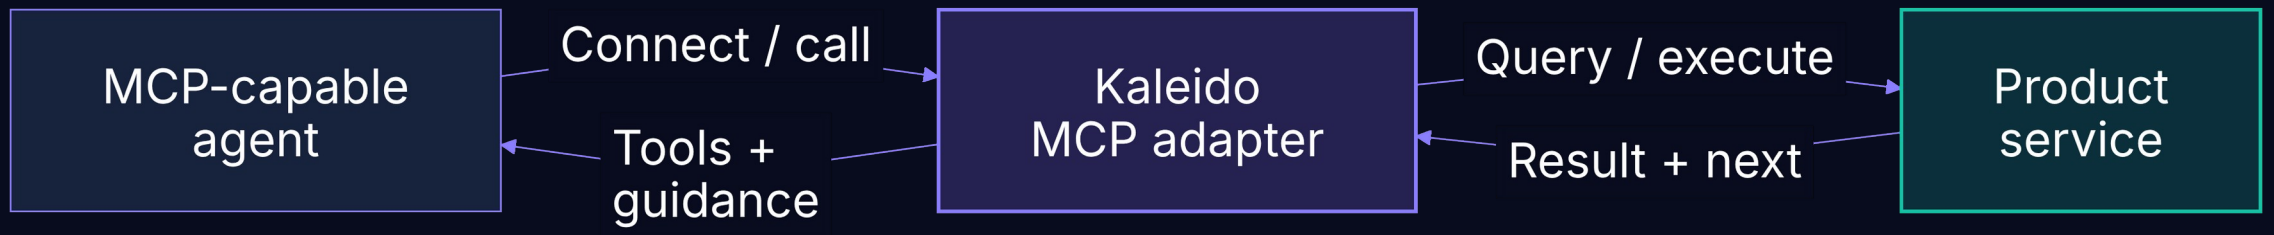

WHEN THE ACTION IS CALLED

Connect the agent. Kaleido supplies the guidance.

No product-specific workflow implementation inside the agent.

THROUGH MCP: TOOLS + SCHEMAS + INSTRUCTIONS + CONTINUATION

Start small.

Entry points and generic helpers.

Get details on demand.

Next can describe actions not on the starting list.

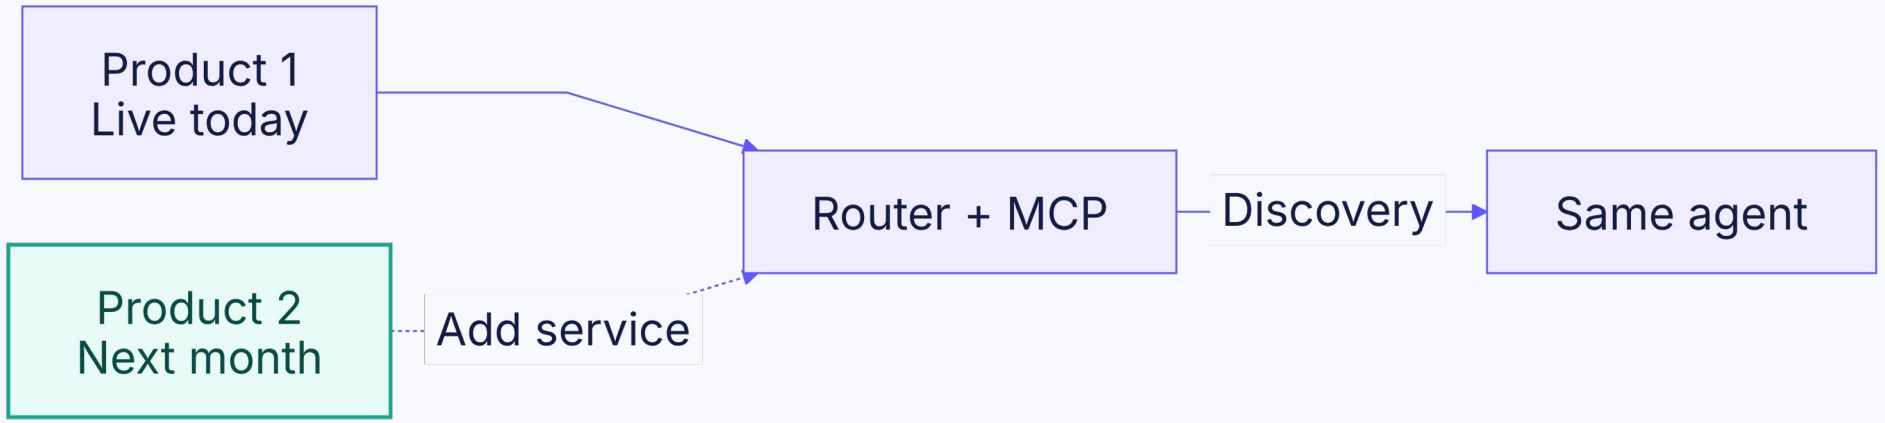

Continue from state.

Required steps, choices, questions and handoffs.

Change the service.
Add products, not agent integrations.

EXISTING PRODUCT New question or next step > service response > same agent

FIVE-PRODUCT EXAMPLE / PRODUCT 1 TODAY, PRODUCT 2 NEXT MONTH

Products 3-5 can follow as their services become ready.

Build and validate the service. Configure access and discovery. No duplicate agent workflow.

REPORTED DEVIN SESSION

The next step arrived in the response.

PriorAuth | 15 October 2026 | FrontDoor mode

START

11

starting tools

Capture Member was not listed.

THE PRECEDING RESPONSE SUPPLIED

`next.required`

`intake_capture_member`

Inputs + lookup details + process context

`howToRun: call_tool`

DEVIN CONTINUED

`call_tool`

Capture Member

completed

6

unlisted capabilities invoked

Submitted

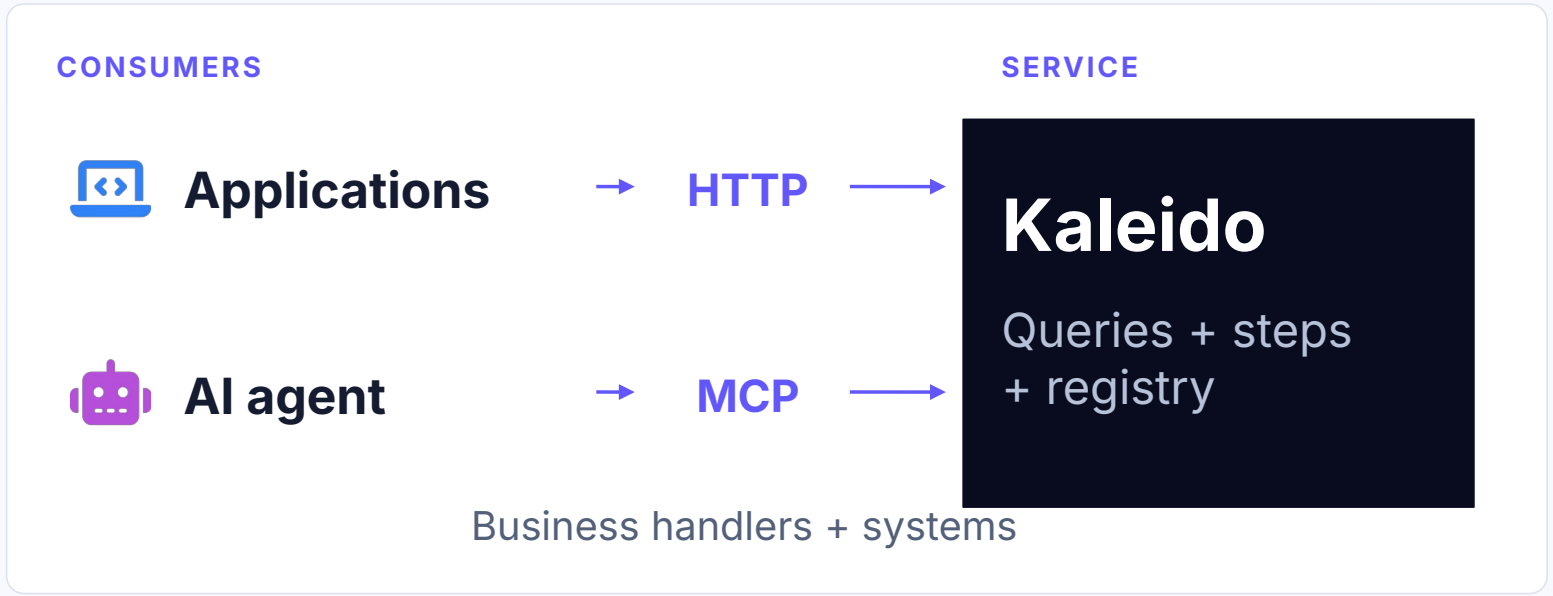

for review - not approved

History

returned status: submitted

Sanitized transcript summary; user-reported session, not independently replayed.

Different interfaces.
The same business execution.

Process state belongs to the service, not to the conversation.

THE SERVICE + HOST OWN

- **Identity and access**
- **Business validation**
- **Required approvals**
- **Production storage**

AI receives the interface.
It does not inherit authority.

EXECUTIVE TAKEAWAY

Connect once.
Let the business evolve.

01 **Connect without a bespoke workflow.**

02 **Evolve without duplicating the change.**

03 **Add products without another agent project.**

The product service remains the source of truth.
